YOU CAN DO THAT!

HOW TO SCAN A QR CODE • YOUR SIMPLE TAKE-HOME GUIDE

What's a QR code?

A little square that works like a shortcut.
It can open a website, video, menu, or other information.

Good news!

Most phones can scan QR codes with the Camera app. You usually don't need to download anything.

5 EASY STEPS

1. OPEN

Open the Camera app—the one you use to take pictures.

2. POINT

Hold your phone so the whole QR code is in the middle of the screen. Keep it steady.

3. WAIT

Give your phone a few seconds. A small link or message should appear.

4. CHECK

Look at the link. Does it go where you expected? If it looks odd, stop and ask.

5. TAP

If it looks right, tap the link. The website or information will open. **That's it!**

Remember:

You do not take a picture. Just point your camera and wait.

TRY IT AGAIN!

BE SAFE:

Use QR codes from sources you trust, such as official Lakeview materials. Check the link before tapping. Never enter banking details or passwords just because a QR code asks you to. If unsure, STOP and ASK.

YOU CAN DO THAT! One little square, one easy step, and a whole new world of information.

WHAT DO I DO IF NOTHING HAPPENS

iPHONE

1. Open Settings (the gear).
2. Tap Camera.
3. Find Scan QR Codes.
4. Turn the switch ON (green).
5. Go back to Camera and try again.

If you don't see this setting, ask for help.
Your phone may use a different version.

ANDROID

Try Camera first.
Many Android phones scan automatically.

If it doesn't work:

1. Open Camera Settings (gear).
2. Look for Scan QR codes and turn it ON, if available.
3. If you don't see it, try Google Lens (a camera-shaped search icon)

Android phones vary. Ask for help if the steps look different.

Try some more that you will see in the Beacon!
